                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A set of peptide ligands for agricultural research and development of therapeutic agents comprise specific complementary peptides to proteins encoded by genes of plant genomes -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of plant genomes e.g. from Arabidopsis thaliana (see AAG83361-AAG84504). The peptides of the present invention are useful in an assay to identify a peptide, especially a peptide pesticide or herbicide. The peptides are also useful for tools for agricultural research and development. The present peptide was used to illustrate the present invention.
            therapeutic agents. The analysis and acquisition of peptide sequences facilitates understanding of protein-protein interactions. The method allows for analysis of an entire database at a time, thus overcoming sampling problems. The present sequence is provided as an example protein sequence in a description of the invention.
                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                      Synthetic immunogenic peptides are provided in which a universal immune stimulator is linked to a peptide or protein hapten containing B cell and/or cytotoxic T lymphocyte epitopes, giving a product which causes potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiscuous helper T cell epitope (Th) which elicits an immune response to the coupled peptide in members of a heterogeneous population expressing diverse HLA phenotypes, and (B) an adjuvant peptide sequence from the invasin protein of Yersinia. Spacer amino acid sequences (e.g. Gly-Gly) can be provided between the invasin and Th domains and between the immune stimulator and hapten
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         components. When the hapten is LHRH, then optionally the invasin domain can be omitted from the immune stimulator component.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a pertussis toxin helper T cell epitope which can be used as Th in the immune stimulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     membrane anchoring domain; helper T cell; surface antigen; core antigen; pertussis toxin; tetanus toxin; measles virus F protein; immunotherapy; Chlamydia trachomatis major outer membrane protein; immunogen; vaccine; diphtheria toxin; plasmodium falciparum; circumsporozoite; E. coli TraT;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           preparation of a peptide immunogen that is useful in vaccines for treating allergic reactions. In the immunogen an IGE CH4 peptide is atteached C-terminally to a series of amino acids including a helper T cell epitope. The immunogen may also opt. contain a farty acid derivative, an invasin domain or alpha-NH2. The immunogen produces high titres of antibodies to the effector site in human IGE heavy chain (the CH4 domain peptide) which inhibit mast cell activation and reduce allergen-induced IgE prodn. The immunogens may be used in either a radially branching multimeric form or a linearly arranged monomeric form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     schistosoma mansoni, triose phosphate isomerase, allergenic reaction, allergic rhinitis; food allergy; anaphylaxis; virally-induced asthma; antihistamine; decongestant; beta-2 agonist; immunosuppression;
IgE: CH4; immunoglobulin; epsilon; immunogen; helper T cell; epitope; vaccine; allergy; antibody; constant heavy chain.

AAW05957-W05616 represent helper T cell epitopes used in the peptide immunogens of the invention. This sequence represents the pertussis toxin helper T cell antigen. The peptides of the invention contain one of these sequences, and a membrane-bound immunoglobulin E (IgE) fragment (see AAW05595 and AAW05596). The peptide immunogens of the invention can be used in vaccines for the immunotherapeutic treatment of allergenic reactions, including allergic rhinitis, food allergies, anaphylaxis, or period of anthhistamines, decongestants, and beta-2 agonists, while preventing the broad immunosuppression of corticosteroids. The peptides do not have the potential side effects of restlessness or sedation (associated with antihistamines), associated increased morbidity in asthmatics (as seen with beta-2 agonists) and adverse hormonal activities (observed in corticosteroid users).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                             Peptide immunogen useful in treatment of allergy - comprises membrane-bound IgE epsilon-chain peptide synthesised linearly in tandem with T helper epitope peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0;

Peptide Production as Fusion Protein in Transgenic Mammal Milk
APPLICANT: Finkel, Terri H.

PEDLICANT: Rozdaial, Moshe M.

TITLE OF INVENTION: PRODUCT AND PROCESS TO REGULATE ACTIN
TITLE OF INVENTION: POLYMERIZATION IN T LYMPHOCYTES
TUMBER OF SEQUENCES: 31
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sheridan Ross & McIntosh

Sequence 15, Application US/07729099

Sequence 15, Application US/07729099

Patent No. 5403581

GENERAL INFORMATION:

APPLICANT: Binger, Mary-Helen

APPLICANT: Basemontes, Luis

TITLE OF INVENTION: Coccidiosis Vaccines

NUMBER OF SEQUENCES: 15

CORRESPONDENCE ADDRESS:

ADDRESSEE: Hoffmann-La Roche Inc.

STREET: 340 Kingsland Street

CITY: Nutley

STATE: New Jersey

COUNTRY: U.S.

ZIP: O7110

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBMP C compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SOFTWARE: PATENTIN RELEASE #1.0, Ver CURRENT APPLICATION DATA:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Title: Guinea pig membrane-bound aminopeptidase P is a member of the proline peptidase
A;Reference number: PC2307; MUID:95110325
A;Accession: PC2307
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   C;Comment: This enzyme is a membrane bound protein.
C;Comment: This enzyme hydrolyzes imido bonds.
C;Comment: This enzyme acts as an aminoacylproline hydrolase and is a member of the prol C;Superfamily: pig X-Pro aminopeptidase
C;Keywords: alpha-aminoacylpeptide hydrolase; membrane protein

G37396

pollen allergen Ant o I - sweet vernal grass (fragment)

C;Species: Anthoxanthum odoratum (sweet vernal grass)

C;Date: 28-Apr-1993 #sequence_revision 28-Apr-1993 #text_change 09-Jun-2000

C;Accession: G37396

Mol. Immunol. 26, 557-561, 1989

A;Title: Isolation and characterization of a major cross-reactive grass group I allergen

A;Reference number: A37396; MUID:89364850

A;Reference of 37396

A;Molecule type: protein

A;Molecule type: protein

A;Residues: 1-26 <ESC>

C;Superfamily: expansin

SECRETION OF GONADOTROPHIN-RELEASE HORMONE.
-!- SUBCELLULLAR LOCATION: SECRETED.
-!- TISSUE SPECIFICITY: ONE OF THE MOST ABINDANT PEPTIDES IN THE NERVOUS SYSTEM. ALSO FOUND IN SOME CHROMAFFIN CELLS OF THE ADRENAL
                                                                                                                                                                                                      FEBS Lett. 217:279-282 (1987).

-1 FUNCTION: LIGHT-HARVESTING PHOTOSYNTHETIC BILE PIGMENT-PROTEIN FROM THE PHYCOBILIPROTEIN COMPLEX. ALLOPHYCOCYANIN HAS A MAXIMUM ABSORPTION AT APPROXIMENTELY 650 NANOMETERS.

-1 SUBUNIT: HETERODIMER OF AN ALPHA AND A BETA CHAIN.
-1 - PRIN: CONTAINS ONE COVALENTLY LINKED BILIN CHROMOPHORE. PIR; B27398; B27398; B27398; B27398; B127398; B12801659; Phycobilisome.

Promise PRO0502; Phycobilisome.

Phycobilisome = Electron transport; Photosynthesis; Bile pigment.

"Comparison of simian immunodeficiency virus isolates.";

Nature 331:1619-627(1988).

-!- FUNCTION: REV APPEASS TO ACT POST-TRANSCRIPTIONALLY TO RELIEVE

NEGATIVE REPRESSION OF GAG AND ENV PRODUCTION.
-!- SUBCELLUAR LOCATION: NUCLEAR; ACCUMILATES IN THE NUCLEOLI.
-!- PTM: PHOSPHOPROTEIN WHOSE STATE OF PHOSPHORYLATION IS MEDIATED

BY A SPECIFIC SERINE KINASE ACTIVITY PRESENT IN THE NUCLEUS.
-!- MISCELLANBOUS: THIS IS A MACAQUE ISOLATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transcription regulation; AIDS; Phosphorylation; Nuclear protein.

Lupus, inflammatory bowel disease, psorlasis, osteoarthritis or HIV infection.

HIV infection.

The fusion protein may be used to target proteoglycans to a given site, which causes local accumulation of GAG-binding proteins. Therefore the protein may be used as adjuvants for vaccination and in the targeting of chemokines to non-immunogenic tumour cells to enhance cellular antitumour responses. In addition, the fusion protein can also enhance the half-life of non-GAG binding growth factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The recombinant fusion protein may be administered to a patient to enhance the biological activity of a GAG-binding protein within the body. The protein also enhances wound healing and may be used to treat rheumatoid arthritis, asthma, chronic obstructive pulmonary disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           part of the surrounding sequence of one of the potential \prime sites in a CD44 exon.
                                                                                                                                                                                             Surrounding sequence of potential assembly site E5-Rg, in CD44

                                                                                                                                                                                                                                               Gaps
                               The peptide can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 150-190 of the CD44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The peptide can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 150-180 of the CD44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of CD44 protein and new peptide derivs - for developing prods for inflammation, immune-mediated tissue damage and tumour cell
                                                                                                                                                                                                                                             .;

New ligands for human erythropoietin receptor, useful for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents the erythropoietin receptor (EPOR)-binding peptide Base and a startide B6. This peptide was identified as baing able to bind a recombinant erythropoietin receptor via biopanning methods. The peptide is a product of an ERB1 (erythropoietin receptor (EPOR)
                                                                                                                                                                             The peptide can be used for treating inflammation and immune-
mediated tissue damage such as occurs in the course of autoimmune
diseases, e.g. rheumatoid arthritis. It can also be used for
determining metastatic potential or to treat or prevent tumor cell
metastasis. This peptide corresponds to AA 150-161, 170-177 and
189-198 of the CD44
                                                                                Use of CD44 protein and new peptide derivs - for developing prods for inflammation, immune-mediated tissue damage and tumour cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EPO; receptor; erythropoietin receptor; EPOR; immunoglobulin G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                fusion protein; vector; cloning; synthetic peptide; biopanning; evolved library; mimetic; proliferation; biological activity; chronic renal failure; malignancy; cancer; chemotherapy; HIV; rheumatoid arthritis; treatment; anaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The peptide can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 161-180 of the CD44
                                                                                                                                                                                                                                                                                                                                                                                      Use of CD44 protein and new peptide derivs - for developing prods for inflammation, immune-mediated tissue damage and tumour cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

                                                                                                                                                                                                                                                                                                         5
binder 1) evolved library which was constructed using redundant oligonucleotides AA23086 and AA23085, and then screened for EPOR-binding activity. Such EPOR-binding peptides are unrelated to the amino acid sequence of EPO and contain a consensus sequence necessary for EPOR binding, CXXGWGXCXXW (AAY42845). Shorter peptides (AAY42846, AAY42847) based on EPOR-binding peptides already shown to bind EPOR with high affinity (AAY4881, AAY42881) were found to stimulate proliferation of an EPO- responsive cell line, thus demonstrating that they had EPO biological activity. Such EPO mimetric peptides can be used in the treatment of anaemia associated with pathological conditions including chronic renal failure, malignancy, the effects of chemotherapy, HIV and rheumatoid arthritis. The peptides are smaller than recombinant EPO used in prior art treatment, and thus less expensive and easier to deliver as a therapeutic agent, compared to prior art methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, fund are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a arxity in molecules this small. The alpha conotoxins can be used as neuromuscular blocking agents in surgery,

The BS106 nucleic acids correspond to a breast tissue gene and can be used as markers for breast tissue disease. The products can be used for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining diseases or conditions associated with BS106, especially breast cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        BS106 is a breast tissue gene with which breast cancer and related diseases are associated. The BS106 polypeptides AAW42088-W42092 can be utilized in a variety of of assays for the detection of antibodies to breast tissue. They can also be used as immunogens for the detection of antibodies to breast tissue. The products and methods discussed in this invention can be used for detecting, diagnosing, staging, preventing or treating, or determining predisposition to diseases or

The invention relates to nucleic acid sequences (AAX22111 to AAX22134) encoding human secreted proteins (AAY01135 to AAY01159). The secreted proteins are deposited with the ATCC under deposit number ATCC 200118. Host cells comprising recombinant vectors containing the nucleic acid sequences are used for the recombinant production of the secreted proteins. The polynucleotide and amino acid sequences are useful for preventing, treating or amino acid sequences are useful for are useful for preventing, treating or amino acid sequences are useful for are useful for preventing, treating or amino acid sequences are useful conditions e.g. by protein or gene therapy. Pathological conditions can be also diagnosed by determining the amount of the mew polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the polynucleotides. Specific uses are described for each of the polynucleotides based on which tissues they are most highly expressed in, and include developmental abnormalities and foetal deficiencies, autoimmune diseases, lymphomas, Alzheimer's and cognitive disorders, cancormalities and foetal disorders, autoimmune diseases, lymphomas, Alzheimer's and cognitive disorders, haematopoietic disorders, inmune deficiency asthma, hamunological disorders, immune disorders, entratidis asthma, hamunological disorders, immune disorders, entratidis asthma, haematopoietic disorders, respiratory disorders, arthritis, asthma, cateoporosis, metabolic disorders, cardiovascular disorders, endocrine disorders or gestroprotes for identifying their binding partners. The present sequence represents a company of the invention (see descriptor is appropriate fragment encoded by a gene of the invention (see descriptor
                                                                                                                                                                      New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, immune deficiency diseases or blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB 20; Length 20;

```
AAX86215 to AAX86333 are the secreted human secreted protein genes.
AAX86215 to AAX86333 are the secreted proteins encoded by the 94 human genes. This sequence represents a fragment of one of the human secreted proteins. This sequence represents a fragment of one of the human secreted proteins. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Also pathological conditions an bediagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 94 genes, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and feetal deficiencies, blood disorders, diseases of the immune system, autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney disorders, digestive/endocrine disorders, indections and AIDS. The polypeptides are also useful for identifying their binding partners.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of diagnosing abnormal levels of growth hormone (GH) activity in the liver, or predicting a change in the condition of the liver in response to abnormal GH activity. The method involves correlating the level of expression of certain specific genes with the level of GH activity in the liver, or with an expected change in the condition of the liver as the result of GH activity. Excessive GH activity in the liver is thought to be deleterious to health, causing an increase in liver size as a consequence of both hyperplasia and hepatocyte hypertrophy, and hepatocellular lesions which progress with eage. Studies in transgenic mice which express high levels of bovine growth hormone identified a number of genes whose expression in the liver is altered by high GH levels. The genes which are upregulated are liver is altered by high GH levels. The genes which are upregulated are thus, rab8-interacting protein, controsteroid binding globulin, fetuin, rab8-interacting protein, paraoxonase-3, cytochrome P450IIIA, S-2 hydroxyacid oxidase, interferon alpha/beta receptor, growth hormone cenceding are submit, and coagulation factor V. Two novel genes, clone 5 (AAC87257) and clone 45 (AAC87258) are also upregulated in response to abnormally high GH levels. Conversely, expression of the formance are conding 3-beta-hydroxysteroid dehydrogense/delta-5-delta-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diagnosis of liver pathologies associated with gigantism or acromegaly or with diabetes, as other causative agents may act directly or indirectly upon the same genes. Sequence ABAH0724-B48739 represent the open reading frames (ORFS) of the novel mouse liver cDNA clone 5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   isomerase appears to be downregulated. The invention also relates to transgenic nonhuman mammals comprising a GH-induced transgene which exhibit or have a propensity to develop a liver pathology; an assay for drugs which inhibit the development of, or which treat a liver pathology; preventing a diversaling the drug to the transgenic animal; and preventing or treating a liver pathology in a patient comprising administering a drug which inhibits the expression of a GH-induced gene. The method of the invention is used for diagnosing abnormal levels of GH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     activity in the liver or predicting a change in the condition of the liver in response to abnormal levels of GH activity. The GH-regulatable liver genes and proteins are useful as diagnostic markers of liver pathology. Assays for the expression of these genes is useful for the
                                                                                                                                                                                                                                                                                                                                                                                                     abnormal levels of growth hormone activity in liver assaying growth transcriptional activity and protein level of hormone-regulatable liver genes, as diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

Novel phosphopeptides - useful for treating dental diseases, rarefying diseases or diseases relating to malabsorption of minerals
                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is an example of a highly generic formula for a phosphopeptide of length 5-13 amino acids. The peptides can be made synthetically (e.g. chemical synthesis or genetic engineering) or they can be extracted from cereals, nuts or vegetables or by fractionating a digest of casein, alpha-s-casein, beta-casein or a salt of it. Compositions comprising the peptide may take the form of foodstuff or confectionery, dentifrices; mouthwashes and preparations for topical application to teeth or gingival tissue. The peptides significantly increase absorption of calcium, phosphate and iron in the gut. See AAR1447-R14451.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NADH dehydrogenase (ubiquinone) (EC 1.6.5.3) 20K chain - potato mitochondrion (fragment)
NADH dehydrogenase (ubiquinone) (EC 1.6.5.3) 20K chain; NADH-ubiquinone oxidoreductase 20K C; Species: mitochondrion Solanum tuberosum (potato)
C; Species: mitochondrion Solanum tuberosum (potato)
C; Species: mitochondrion Solanum tuberosum (potato)
C; Date: 12-May-1994 #sequence_revision 12-May-1994 #text_change 07-May-1999
C; Accession: 649732
